Etc.

Symmetric - Secret Key Encryption - Decryption

Public Key Cryptography - PKC

Principles of Public Key Cryptography

Instead of using single symmetric key shared in advance by the parties for realization of symmetric cryptography, asymmetric cryptography uses two *mathematically* related keys named as private key and public key we denote by **PrK** and **PuK** respectively.

PrK is a secret key owned *personally* by every user of cryptosystem and must be kept secretly. Due to the great importance of **PrK** secrecy for information security we labeled it in red color. **PuK** is a non-secret *personal* key and it is known for every user of cryptosystem and therefore we labeled it by green color. The loss of **PrK** causes a dramatic consequences comparable with those as losing password or pin code. This means that cryptographic identity of the user is lost. Then, for example, if user has no copy of **PrK** he get no access to his bank account. Moreover his cryptocurrencies are lost forever. If **PrK** is got into the wrong hands, e.g. into adversary hands, then it reveals a way to impersonate the user. Since user's **PuK** is known for everybody then adversary knows his key pair (**PrK**, **Puk**) and can forge his Digital Signature, decrypt messages, get access to the data available to the user (bank account or cryptocurrency account) and etc.

Let function relating key pair (PrK, Puk) be F. Then in most cases of our study (if not declared opposite) this relation is expressed in the following way:

PuK=F(PrK).

In open cryptography according to Kerchoff principle function F must be known to all users of

cryptosystem while security is achieved by secrecy of cryptographic keys. To be more precise to compute \mathbf{PuK} using function \mathbf{F} it must be defined using some parameters named as public parameters we denote by \mathbf{PP} and color in blue that should be defined at the first step of cryptosystem creation. Since we will start from the cryptosystems based on discrete exponent function then these public parameters are

$$\mathbf{PP} = (\boldsymbol{p}, \boldsymbol{g}).$$

Notice that relation represents very important cause and consequence relation we name as the direct relation: when given **PrK** we compute **PuK**.

Let us imagine that for given F we can find the inverse relation to compute PrK when PuK is given. Abstractly this relation can be represented by the inverse function F^{-1} . Then

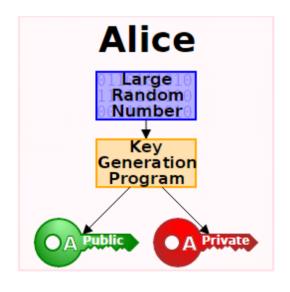

$$\mathbf{PrK} = \mathbf{F}^{-1}(\mathbf{PuK}).$$

In this case the secrecy of \mathbf{PrK} is lost with all negative consequences above. To avoid these undesirable consequences function \mathbf{F} must be **one-way function** – OWF. In this case informally OWF is defined in the following way:

- 1. The computation of its direct value PuK when PrK and F in are given is effective.
- 2. The computation of its inverse value \mathbf{PrK} when \mathbf{PuK} and \mathbf{F} are given is infeasible, meaning that to find \mathbf{F}^{-1} is infeasible.

The one-wayness of *F* allow us to relate person with his/her **PrK** through the **PuK**. If *F* is 1-to-1, then the pair (**PrK**, **Puk**) is unique. So **PrK** could be reckoned as a unique secret parameter associated with certain person. This person can declare the possession or **PrK** by sharing his/her **PuK** as his public parameter related with **PrK** and and at the same time not revealing **PrK**. So, every user in asymmetric cryptography possesses key pair (**PrK**, **PuK**). Therefore, cryptosystems based on asymmetric cryptography are named as **Public Key CryptoSystems** (PKCS). We will consider the same two traditional (canonical) actors in our study, namely Alice and Bob. Everybody is having the corresponding key pair (**PrK**_A, **PuK**_A) and (**PrK**_B, **PuK**_B) and are exchanging with their public keys using open communication channel as indicated in figure below.

Asymmetric - Public Key Cryptography

Threaths of insecure PrK generation

Ip = { 1, 2,3, --, p-1}; * mod p

PrK and PuK are related
PuK = F(PrK)

F is one-way function

Having PuK it is infeasible to find

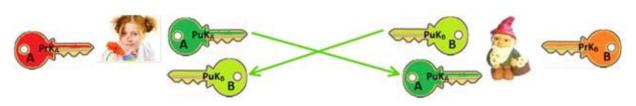

$$PrK = F^{-1}(PuK)$$

 $\mathbf{F}(\mathbf{x}) = \mathbf{\alpha}$ is OWF, if:

- 1.It easy to compute α , when F and x are given.
- \widehat{a} 2.It is infeasible compute **x** when **F** and **a** are given.

PrK = x < -- randi ==> PuK = $a = g^x \mod p$ Public Parameters PP = (p, g)

Message m < p Public Parameters PP = (p, g)

 $PrK = x < -- randi ==> PuK = a = g^x \mod p$

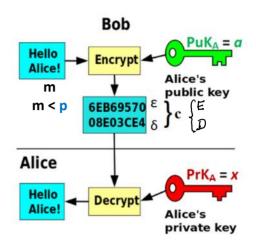

Asymmetric Signing - Verification

$$Sign(PrK_A, h) = G = (r, s)$$

$$V=Ver(PuK_A, h, G), V \in \{True, False\} \equiv \{1, 0\}$$

Asymmetric Encryption - Decryption c=Enc(PuK_A, m) m=Dec(PrK_A, c)

ElGamal Cryptosystem

1.Public Parameters generation PP = (p, g).

Generate strong prime number p: >> p=genstrongprime(28) % strong prime of 28 bit length Find a generator g in Z_p *= {1, 2, 3, ..., p-1} using condition.

Strong prime p=2q+1, where q is prime, then g is a generator of \mathbb{Z}_{p}^{*} iff $g^{q} \neq 1 \mod p$ and $g^{2} \neq 1 \mod p$.

Declare **Public Parameters** to the network PP = (p, g);

p= 268435019; **g=2**; 2^28-1= 268,435,455

>> 2^28-1 ans = 2.6844e+08 >> int64(2^28-1) ans = 268435455

 $PrK = x < -- randi ==> PuK = a = g^x \mod p$

Asymmetric Encryption-Decryption: El-Gamal Encryption-Decryption

Let message m^{\sim} needs to be encrypted, then it must be encoded in decimal number m: 1 < m < p. E.g. m = 111222. Then $m \mod p = m$.

$$A: \frac{PuK_A = \alpha}{m \text{ to } A: m < p}$$

B:
$$i \leftarrow randi(I_p^*)$$

$$E = m \cdot Q^i \mod p$$

$$c = (E, D) \longrightarrow f$$
 is able to decrypt

$$E = m \cdot Q^{i} \mod p$$

$$C = (E, D) \longrightarrow f_{i} \text{ is able to dearypt}$$

$$C = (E, D) \text{ using her } P_{i} K = X.$$

$$(- \times) \mod (p-1) = (0 - \times) \mod (p-1) = 1. \quad D^{-\times} \mod (p-1) \mod p$$

$$= (p-1 - \times) \mod (p-1)$$

$$(p-1) \mod (p-1) = 0. \quad \text{since}$$

$$(- \times) \mod (p-1) = 0. \quad \text{since}$$

$$(- \times) \mod (p-1) = (p-1 - \times)$$

$$D^{-\times} \mod (p-1) = D^{p-1-\times} \mod (p-1)$$

$$D^{-\times} \mod (p-1) = D^{p-1-\times}$$

$$D^{-\infty} \mod (p-1)$$

p mod p computation using Fermat theorem:

If p is prime, then for any integer p in Z_p * holds p.

$$D^{P-1} = 1 \mod p \qquad / \bullet D^{-X} \mod (p-1) \mod p$$

$$D^{P-1} \cdot D^{-X} = 1 \cdot D^{-X} \mod p \implies D^{P-1-X} = D^{-X} \mod p$$

$$\mathcal{D}^{\mathsf{X}} \mod p = \mathcal{D}^{\mathsf{P}-1-\mathsf{X}} \mod p$$

Correctness

$$Enc(PuK_A = a, i, m) = c = (E, D) = (E = m \cdot a^i mod p; D = g^i mod p)$$

$$Dec(PrK_A = X, c) = E \cdot D^i mod p = m \cdot a^i \cdot (g^i)^{-i} mod p =$$

$$= m \cdot (g^x)^i \cdot g^{-ix} = m \cdot g^{xi} \cdot g^{-ix} = m \cdot g^{xi} - ix d p = m \cdot g^i mod p =$$

 $= m \cdot 1 \mod P = m \mod P = m = 111222$ Since m < P

If
$$m > p \rightarrow m \mod p \neq m$$
; $27 \mod 5 = 2 \neq 27$. ASCII: 8 bits per char. If $M ; $19 \mod 31 = 19$. $\frac{2048}{8} = 256 \text{ char}$. Decryption is correct if $m < p$.$

El Gamal encryption is probabilistic: encryption of the same message in two times yields the different cyphertexts

C₁ and C₂.
1-st encryption: 2-nd encryption

$$i_1 \leftarrow randi(\mathcal{Z}_p^*)$$
 $i_1 \neq i_2$ $i_2 \leftarrow randi(\mathcal{Z}_p^*)$
 $E_1 = [m] \cdot Q^{i_1} \mod P \setminus C_1 = (E_1, D_1)$ $E_2 = [m] \cdot Q^{i_2} \mod P \setminus C_2 = (E_2, D_1)$

$$E_{1} = [m] \cdot Q^{i_{1}} \mod p$$

$$C_{1} = [E_{1}, D_{1}]$$

$$E_{2} = [m] \cdot Q^{i_{2}} \mod p$$

$$C_{2} = [E_{1}, D_{2}]$$

$$E_{2} = [m] \cdot Q^{i_{2}} \mod p$$

$$C_{2} = [E_{2}, D_{2}]$$

$$C_{1} \neq C_{2}$$

$$Enigma$$

Necessity of probabilistic encryption.

Encrypting the same message with textbook RSA always yields the same ciphertext, and so we actually obtain that any deterministic scheme must be insecure for multiple encryptions.

Tavern episode Enigma

Authenticated Key Agreement Protocol using ElGamal Encryption and Signature. Hybrid encryption for a large files combining asymmetric and symmetric encryption method.

Hybrid encryption. Let **M** be a large finite length file, e.g. of gigabytes length.

Then to encrypt this file using asymmetric encryption is extremely ineffective since we must split it into millions of parts having 2048 bit length and encrypt every part separately.

The solution can be found by using asymmetric encryption together with symmetric encryption, say AES-128. It is named as **hybrid encryption method**.

For this purpose the Key Agreement Protocol (KAP) using asymmetric encryption to exchange the same symmetric secret key k agreement must be realized. 2-nd encryption of M realized by symmetric encryption method, say AES-128.

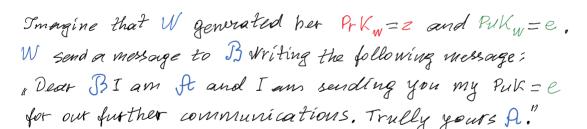

k=randi(\mathbb{Z}_p^*) c_k =Enc(PuK_B,i,k) = (E, D) **M**-massage to be encrypted with symmetric encryption method e.g. AES128

 $C_k = E(k, M) = AES128(k, e, M)$

 $h=H(C_k)$ $Sign(PrK_A,h) = \sigma = (r, s)$

Till this place

AKAP: Asym.Enc & Digital Sign.

How to encrypt large data file M: Hybrid enc-dec method. 1. Parties must agree on common symmetric secret key for symmetric block cipher, e.g. AES-128, 192, 256 bits. · Jumoure ower - proof and proof

$$\mathcal{A}: P_{r}K_{A}=x; P_{u}K_{A}=a.$$
 $P_{u}K_{B}=b.$
