

Dear Students.

The Mid-Term Exam (MTE) will be held on Monday, 4-th of November, at 17:00.

Part of the students will be allowed to pass the MTE distantly through the Zoom:

<https://liedm.zoom.us/j/9999112448>

Passcode: 12345678

Those who will participate contactly must to bring their own computers to connect to the Zoom, and to launch the Octave software with installed my .m files on them.

Otherwise you must to install and launch Octave in class computer together with installed my .m files on them.

During the MTE you must solve 2 problems:

1. Diffie-Hellman Key Agreement Protocol - DH KAP.
2. Man-in-the-Middle Attack (MiMA) for Diffie-Hellman Key Agreement Protocol - DH KAP.

The problems are presented in the site:

[imimsociety.net](http://imimsociety.net)

In section 'Cryptography':

[Cryptography \(imimsociety.net\)](http://imimsociety.net/Cryptography)

Please register to the site and after that you receive 10 Eur virtual money to purchase the problems.

If the solution is successful then you are invited to press the green button [**Get reward**].

Then 'Knowledge bank' will pay you the sum twice you have payed.

So if the initial capital was 10 Eur of virtual money and you buy the problem of 2 Eur, then if the solution is correct your budget will increase up to 12 Eur.

You can solve the problems in imimsociety as many time as you wish to better prepare for MTE.

I advise you to try at first to solve the problem in 'Intellect' section to exercise the brains.

It is named as 'WOLF, GOAT AND CABBAGE TRANSFER ACROSS THE RIVER ALGORITHM'.

<<https://imimsociety.net/en/home/15-wolf-goat-and-cabbage-transfer-across-the-river-algorithm.html>>

The more details I explain in may 5-th in 2024.10.07.

The pictures of problems listed above are the following.

**Cryptography:**  
**Information confidentiality, integrity,**  
**authenticity, person identification**

**Symmetric Cryptography** ----- **Asymmetric Cryptography**  
**Secret Key Cryptography** **Public Key Cryptography**

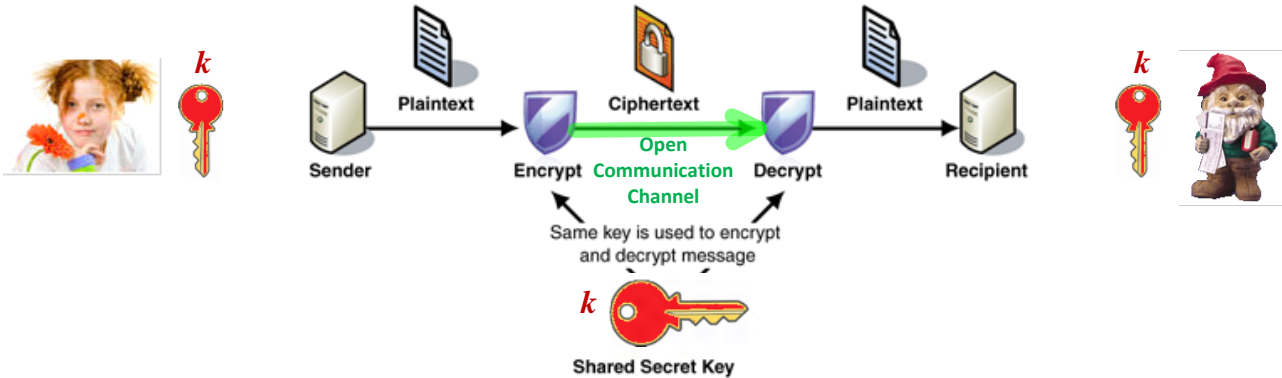

Symmetric encryption

Asymmetric encryption

Symmetric encryption  
 H-functions, Message digest  
 HMAC H-Message Authentication Code

Asymmetric encryption  
 E-signature - Public Key Infrastructure - PKI  
 E-money, Blockchain  
 E-voting  
 Digital Rights Management - DRM (Marlin)  
 Etc.

### Symmetric - Secret Key Encryption - Decryption

*Imagine that number of users of cryptosystem is 100.*

$$C_{100}^2 = \frac{100 \cdot 99}{2} = 4950$$

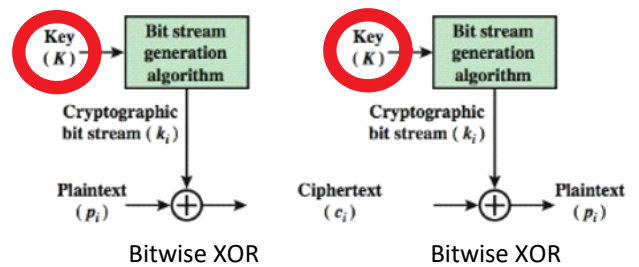

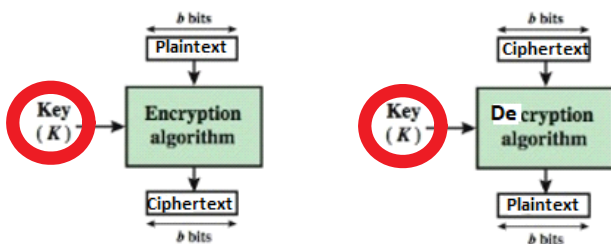

### Symmetric ciphers

Block Ciphers  
 AES-128, 192, 256  
 Advanced Encryption Standard

Stream Ciphers  
 Vernam cipher: based on binary XOR operation

*2<sup>40</sup> → 1 Tb*

>> int64(2^64)  
 ans = 9223372036854775807

*2<sup>64</sup> bits with required randomness properties*

### Vernam cipher (1917) - One Time Pad

Logical operations

$A \cup B$

$A \cap B$

$A \oplus B$

"0" No  $m \in \{0,1\}$   
 "1" Yes

$k \leftarrow \text{rand}\{0,1\}$  ;  $k \in \{0,1\}$

$c = m \oplus k$

$\xrightarrow{c}$   
 if  $c = 0$   
 if  $c = 1$

A	B	$A \oplus B$
0	0	0
0	1	1
1	0	1
1	1	0

m	k	$m \oplus k = c$
0	0	0
0	1	1
1	0	1
1	1	0

$\oplus$  - is inverse to itself

$\Pr(k=0) = \Pr(k=1) = 1/2$

$c = m \oplus k - k = m$

$c = m \oplus k \oplus k =$

$= m \oplus 0 = m = 1$

Requirements :

1. Key  $k$  must be generated at random and uniformly. standard FIPS - 140-2.
2. Key  $k$  must have the same length as plaintext  $m$ .
3. Key  $k$  must be used only once.

Let  $m_1 \in \{0,1\}^N$ ,  $k \in \{0,1\}^N$  ;  $m_2 \in \{0,1\}^T \rightarrow m_2 = 1$

$c_1 = m_1 \oplus k$

$m_1 = c_1 \oplus k$

$c_2 = m_2 \oplus k$

$m_2 = c_2 \oplus k$

So : gets  $c_1, c_2$

Notice that relation represents very important cause and consequence relation we name as the direct relation: when given **PrK** we compute **PuK**.

Let us imagine that for given **F** we can find the inverse relation to compute **PrK** when **PuK** is given. Abstractly this relation can be represented by the inverse function  $F^{-1}$ . Then

$$\text{PrK} = F^{-1}(\text{PuK}).$$

In this case the secrecy of **PrK** is lost with all negative consequences above. To avoid these undesirable consequences function **F** must be **one-way function** – OWF. In this case informally OWF is defined in the following way:

1. The computation of its direct value **PuK** when **PrK** and **F** in are given is effective.
2. The computation of its inverse value **PrK** when **PuK** and **F** are given is infeasible, meaning that to find  $F^{-1}$  is infeasible.

The one-wayness of **F** allow us to relate person with his/her **PrK** through the **PuK**. If **F** is 1-to-1, then the pair (**PrK**, **PuK**) is unique. So **PrK** could be reckoned as a unique secret parameter associated with certain person. This person can declare the possession or **PrK** by sharing his/her **PuK** as his public parameter related with **PrK** and and at the same time not revealing **PrK**.

So, every user in asymmetric cryptography possesses key pair (**PrK<sub>A</sub>**, **PuK<sub>A</sub>**). Therefore, cryptosystems based on asymmetric cryptography are named as **Public Key CryptoSystems** (PKCS).

We will consider the same two traditional (canonical) actors in our study, namely Alice and Bob.

Everybody is having the corresponding key pair (**PrK<sub>A</sub>**, **PuK<sub>A</sub>**) and (**PrK<sub>B</sub>**, **PuK<sub>B</sub>**) and are exchanging with their public keys using open communication channel as indicated in figure below.

Animation: Key generation

<https://imimsociety.net/en/14-cryptography>

**PrK** and **PuK** are related

$$\text{PuK} = F(\text{PrK})$$

**F** is one-way function - OWF:

It is easy to compute **PuK** when **F** and

**PrK** are given.

**Kerchoff principle.**

Having **PuK** and **F**, it is infeasible to

find  $\text{PrK} = F^{-1}(\text{PuK})$ .

**Public Parameters PP = (p, g)**

$$p \sim 2^{2048} \approx 10^{760}; |p| = 2048 \text{ b.} \\ = 760 \text{ dec. digits}$$

We will use  $|p| = 28$  bits.

To generate **PrK** and **PuK** we need to generate  $\text{PP} = (p, g)$

$$\text{PrK} = x \leftarrow \text{randi} \implies \text{PuK} = a = g^x \text{ mod } p$$

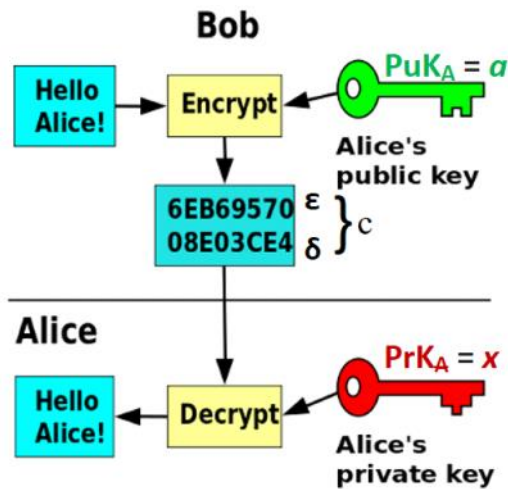

Open SSL software  
Python  
Go

$|Prk| = 2048 \text{ bits}$   
 $|Puk| = 2048 \text{ bits}$   $[1, 2^{2048}]$

### Asymmetric Encryption - Decryption

$$c = \text{Enc}(\text{PuK}_A, m)$$

$$m = \text{Dec}(\text{PrK}_A, c)$$

### Asymmetric Signing - Verification

$$\text{Sign}(\text{PrK}_A, m) = \sigma = (r, s)$$

$$V = \text{Ver}(\text{PuK}_A, m, s), V \in \{\text{True}, \text{False}\} \equiv \{1, 0\}$$

## 1. Identification.

If person can prove that he/she knows **PrK** corresponding to his/her **PuK** without revealing any information about **PrK** then everybody can trust that he is communicating with person possessing (**PrK**, **PuK**) key pair. This kind of proof is named as **Zero Knowledge Proof** (ZKP) and plays a very important role in cryptography. It is very useful to realize identification, Digital Signatures and many other cryptographically secure protocols in internet. In many cryptographic protocols, especially in identification protocols **PrK** is named as **witness** and **PuK** as a **statement** for **PrK**.

Every actor is having the corresponding key pair (**PrK<sub>A</sub>**, **PuK<sub>A</sub>**) and all **PuK** are exchanged between the users using open communication channel as indicated in figure below.

Let Bob is sure that **PuK<sub>A</sub>** is of Alice and wants to tell Alice that he intends to send her his photo with chamomile flowers dedicated for Alice. But he wants to be sure that he is communicating only with Alice itself and with nobody else. He hopes that at first Alice will prove him that she knows her secret **PrK<sub>A</sub>** using ZKP protocol. In general, this protocol is named as identification protocol, it is interactive and has 3 communications to exchange the following data named as **commitment**, **challenge** and **response**.

## One-Way Functions
